RSA SECURID® ACCESS

Standard Agent Client Implementation Guide

Cisco AnyConnect Secure Mobility Client

Peter Waranowski, RSA Partner Engineering Last Modified: May 16th, 2017

Solution Summary

Cisco AnyConnect leverages Cisco ASA to provide RSA SecurID Access authentication. Cisco ASA integrates with RSA SecurID Access via RADIUS or native UDP agent integration.

Cisco AnyConnect for Windows supports RSA token automation which enhances the end user experience. This feature allows AnyConnect to retrieve Passcodes and Tokencodes from tokens installed in the RSA Software Token application. AnyConnect will then 'listen' for SecurID prompts and programmatically retrieve Tokencodes and Passcodes from the software token behind the scenes.

RSA SecurID Access Features				
Cisco AnyConnect				
Authentication Manager Methods RSA SecurID On Demand Authentication Risk-Based Authentication Cloud Authentication Service Methods Authenticate App FIDO Token	Yes Yes No Yes No			
Identity Assurance				
Collect Device Assurance and User Behavior	No			
Software Token Automation				
Windows Mac Android iOS	Yes No No No			

Partner Product Configuration

Before You Begin

This section provides instructions for configuring the Cisco AnyConnect client to work with RSA SecurID Access. This document is not intended to suggest optimum installations or configurations.

It is assumed that the reader has both working knowledge of all products involved, and the ability to perform the tasks outlined in this section. Administrators should have access to the product documentation for all products in order to install the required components.

All Cisco components must be installed and working prior to the integration. Perform the necessary tests to confirm that this is true before proceeding.

Integration Summary

Configuring RSA SecurID Access Authentication

- Desktop
- Mobile

Configuring RSA SecurID Software Token Automation

• Desktop (Windows only)

Configuring Cisco AnyConnect

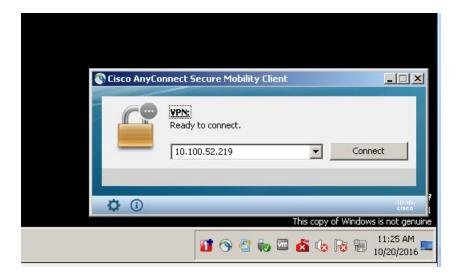

When configuring Cisco AnyConnect for use with RSA SecurID Access Cloud Authentication Service via RADIUS, you will need to increase the AuthenticationTimeout value. The default value of 12 seconds does not provide sufficient time for the end user to complete out of band challenges.

The following example changes the authentication timeout to 120 seconds.

Desktop

RSA SecurID Authentication is configured on the VPN server via RADIUS or Native RSA SecurID agent integration. No additional configuration on the AnyConnect client is required.

Enter the hostname or IP address of your VPN server in the **VPN:** text field and click **Connect**.

Mobile

RSA SecurID Authentication is configured on the VPN server via RADIUS or Native RSA SecurID agent integration. No additional configuration on the AnyConnect client is required.

1. Tap Add VPN Connection...

2. Enter a **Description** and **Server Address** for your VPN server and tap **Save**.

3. Slide the **AnyConnect VPN** switch to start the connection to your VPN server.

- 5 -

Configuring RSA Software Token Automation

Desktop - Windows

To enable RSA Software Token Automation:

- 1. Install the 32-bit RSA Software Token with Automation application on the same system as Cisco AnyConnect.
- 2. Import RSA Software Token(s) into the RSA Software Token Application.
- 3. Restart the Cisco Any Connect client if it is currently running.

Important: You must install the 32 bit version of RSA Software Token in order to enable the software token automation feature.

The default integration behavior is to prompt for "PIN or Passcode" when the software token is available. The user can authenticate using either a hardware token or an installed software token. The integration can be configured to use only a hardware token (prompt for Passcode) or only a software token (prompt for PIN) by modifying the AnyConnect Client Profile on the Cisco ASA server.

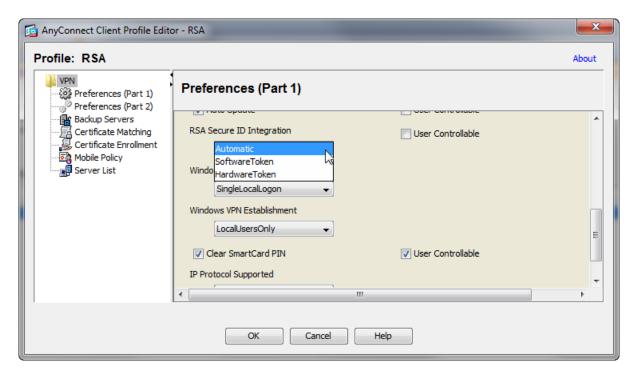

To modify the Any Connect Client Profile:

- 1. Open the **Cisco ASDM** administrative console.
- 2. Browse to Configuration > Network (Client) Access > AnyConnect Client Profile and click Add or Edit.

3. Under **Preferences (Part 1)**, locate the **RSA SecurID Integration** menu and make your selection.

- **Automatic** Prompts the user for 'PIN or Passcode' and allows for authentication using either a hardware or software token.
- **SoftwareToken** Prompts the user for 'PIN' and allows for authentication using a software token only.
- HardwareToken Prompts the user for 'Passcode' and allows for authentication using a hardware token only.
